

AOC stands for optical fiber

Overview

An Active Optical Cable (AOC) is an integrated optical transceiver assembly that uses fiber optics to transmit high-speed data over longer distances than passive copper cables. The term "active" signifies that electrical components are used to boost and convert the signal along the way. Unlike traditional fiber-optic cables, which require external transceivers to send and receive signals, AOC cables have the necessary transceivers integrated. From data centers to cloud computing, AOCs play a crucial role in achieving operational flexibility, scaling, and high-speed data throughput along with low latency. AOCs have transformed the interconnection and management of high-performance systems by merging the advantages of optical fiber and. Active Optical Cable (AOC) are distinguished from other cable types by their use of optical fiber coupled with electrical to optical conversion at each end.
