

Does the LAN contain an access layer switch

Overview

The access layer consists of layer 3 switches, which take routed and switched data packets from the distribution switches and then route them to the access devices in subnets. The access devices in subnets can be modems, video display units, receiver audio phones, IP-based. Access Layer: The access layer is the layer where access devices are installed. This layer is directly connected to subnets. Access. An access switch is a network edge device that directly connects end-user hardware such as computers, IP phones, wireless access points, cameras, and IoT devices to the broader network. It typically sits at the access layer, provides high port density, often delivers PoE, and forwards traffic. A typical enterprise hierarchical LAN campus network design includes access layer, distribution layer, and the core layer.
