

Eye diagram measurement of multiple modes

Overview

Eye diagrams are an electrical measurement that is not data dependent. Adding high-speed signal conditioners can improve an eye diagram. PLTS constructs measurement-based eye diagrams (or patterns) by convolving the calculated time domain impulse response (generated from frequency domain measurement data) with a synthesized pattern of bit sequences. This paper describes what an eye diagram is, how it is constructed, and common methods of triggering used to generate one. It also discusses some basic ways that transmitters, channels, and. These eye mask definitions specify transmitter output performance in terms of normalized amplitude and time in such a way to ensure far-end receivers can consistently tell the difference between one and zero levels in the presence of timing noise and jitter. WHAT COULD POSSIBLY GO WRONG?

1. DIFFERENTIAL SIGNALS – Connect 2 scope channels to differential signal of the DUT – Switch on differential math with Differential and Common Mode signal as output.
