

Fiber Optic Collimator U-shaped Platform

Overview

The U-Benches are based on the stable FiberBench platform with a FiberPort on either end. FiberPorts can be used to provide a stable platform for coupling light into and out of FC/PC, FC/APC, or SMA terminated fiber with five or six directional adjustments. Our Polaris[®] Kinematic Collimators offer high-quality. This is the cheapest and most compact solution, but such a fiber collimator is permanently attached to a fiber. The beam's performance is governed by two primary parameters: 1) Beam Divergence. 275 – with BeamTuning or other beam shaping elements to obtain any desired output beam while maintaining a. Fiber-optic collimators are used to launch the light from an optical fiber into a free space collimated beam with specified beam diameter or spot size. In essence, a simple collimation lens is all that is needed for this purpose.
