

Function of DC Monitoring Distribution Box

Overview

A DCDB is a device that receives direct current (DC) electricity from solar PV modules and channels it safely to the inverter. It plays the role of a protection and monitoring unit on the DC side of a solar energy system. The hub distributes electrical power from a single input source to various circuits throughout a building. Whether it's a home, office, or factory. The intelligent AC/DC power distribution box is a distribution automation measurement and control terminal applied to line distribution transformers. The BCM series precision power distribution monitoring unit is used to monitor the power operation parameters of the AC/DC array cabinet in the data center, measure the voltage, current, electric energy, harmonic and other electrical parameters of the incoming line. Solar power generation systems are extremely beneficial in residential, commercial, and industrial sectors, and the trend towards safe, orderly, and reliable DC power management is becoming increasingly important.
