

How many main fibers can be connected to a splitter

Overview

Feeder Fiber: A single feeder fiber connects the OLT to a Stage 1 splitter (e., 1:4) in a primary enclosure. **Distribution Fibers (Stage 1 to 2):** Four distribution fibers run from the Stage 1 splitter to four secondary enclosures, each housing a Stage 2. A fiber broadband provider typically determines and overall split ratio for the network, such as 1x32 or 1x64, and uses combinations of splitters to meet that ratio with each PON port. As XGS-PON continues to be adopted, some service. A fiber optic splitter is a passive optical component that divides a single incoming optical signal into two or more outgoing signals, or combines multiple incoming signals into one. On the other side of the splitter, 32 fibers are routed through distribution panels, splice ports and/or access point connectors to 32 customers' homes, where it is. According to the manufacturing technology of fiber optic splitters, there are mainly two types of splitters: PLC splitter and FBT splitter. PLC splitter is a fiber splitter manufactured based on planar lightwave circuit technology, which can achieve even distribution of optical signals.
