

# How to run fiber optic cables in a server rack without them getting messy

## Overview

A common approach is to run cables across the rear of the rack before routing them up or down through cable managers, which keeps them grouped by function and reduces tangles. Let's examine the specialized techniques and components needed to properly organize, route, and protect fiber optic cables in server rack environments. Start with proper planning: Moreover, we'd better consider planning for installing additional cabinets, servers, and network components. I'm building one from scratch for the first time though. Have ~200 cables coming in through a drop in the ceiling, and trying to decided on the best way to feed them into the patch. High-density fiber cabling has emerged as a fundamental necessity in contemporary enterprise IT environments, where the demand for speed, reliability, and scalability is at an all-time high. This helps make individual cables easier to trace later, supports cleaner bundling, and leaves room for future changes. How do you figure out the right number of rack units for your network rack?
