

How to use a special cable tie for optical cables

Overview

Use gentler options: Hook-and-loop, low-tension, and releasable ties protect fibers. Fiber is fragile: The right cable tie prevents crushing and signal degradation. Standards matter: Follow TIA-568, BICSI, NFPA 70, and UL requirements. Therefore, installing these cables requires careful handling and extra. This method uses 2 optical fibers contained in a single fiber optic cable and physically connects to ports at each end which houses the transmitter and receiver in a single assembly. Outdoor cable may be direct buried, pulled or blown into conduit or innerduct, or installed aerially between poles. Indoor cables can be installed in raceways, cable trays above ceilings or under. Cable ties, frequently called zip ties, are adaptable securing devices used for different purposes, including collecting electrical cables or tying things up for transportation.
