

Is the router s fiber optic cable underground

Overview

That conduit is typically buried at least 18-24 inches below the surface, sometimes deeper depending on local code and terrain. Along the way, fiber networks include underground handholes (small vaults close to the ground). Inside those vaults, you'll find splice enclosures: sealed, padded housings. A fiber cable (drop) is run from a nearby terminal that could be either a pole or an underground box) to your home. A small box on the outside of your home called a NID is installed and the fiber is coiled in there and connected to a fiber that runs into the home. In cases where no conduit is available, a small ditch might be required from the street to the house to facilitate the running of the. For longer distances, fiber-optic cables are typically installed by hanging them between poles (aerial), laying them on the seabed (submarine), or burying them in the ground (underground).
