

# Main switch of factory primary distribution box

## Overview

**Main Switch:** This is the “master control” for the entire distribution box, allowing the entire system to be turned off or on. In an emergency, flipping this switch cuts power to all circuits immediately, ensuring that maintenance and troubleshooting can be done safely. Primary distribution systems consist of feeders that deliver power from distribution substations to distribution transformers. This panel houses the main circuit breaker, which controls. Typical equipment for this system arrangement is a single unit substation consisting of a fused primary switch, a transformer of sufficient size to supply the loads, and a low-voltage switchboard. This arrangement is shown in Radial System with Primary Selectivity. If two utility sources are. ABB's medium voltage switchgear (1 kV to 52 kV according to the IEC standards) are designed to connect and protect an evolving grid. It receives a single, high-amperage power feed and divides it into multiple. As the main switch is separated from the whole distribution box, it can also be used as the power supply terminal (including bus bar) for the protection function of switching, and can also be used as the backup protection circuit of feeder.
