

Micro-modules for data centers

Overview

A micro-module data center is a modular form of data center infrastructure that divides the facility into independent, standardized zones. Each module encompasses critical systems like power supply, cooling, monitoring, and IT racks, creating a self-contained computing ecosystem. Micro data centers enable Industry 4.0 and edge computing by bringing IT wherever you need it most. It uses racks as the datacenter carrier and fully integrates all sub-systems including UPSs, cooling, power distribution, lightning protection, fire control (optional), wiring, airflow management, intelligent. Preferred choice for small- and medium-sized DCs, integrating power supply and distribution, cooling, rack, contained aisle, and monitoring systems to realize one DC per module. The category spans 30 kW micro-modules tucked inside an enterprise floorplate, containerized 500 kW edge units. Micro-module data centers have achieved stepped technological evolution through an innovative "prefabricated, intelligent, and product-oriented" architecture. In the early stage, they mainly adopted closed cold aisle combined with air cooling.
