

Optical Amplifier Noise Factor

Overview

The noise factor is defined as the unitless ratio of the output noise power of a device to the portion thereof attributable to thermal noise in the input termination at standard noise temperature T_0 (usually 290 K). These figures of merit are used to evaluate the performance of an amplifier or a radio receiver, with lower values indicating. The noise factor F of an (electronic or optical) amplifier is a measure of how much excess noise the amplifier adds to the signal. In-line amplifiers: Periodically amplify signal due to fiber attenuation, high G , high P_{sat} . An illustration of the effective gain is given below. Note the presence of a gain peak around 1530nm and a semi-flat gain. Electrical noise figure (NF) is standardized since many decades. Problematic aspects, in conflict with electrical NF: Optical signals have in-phase and quadrature components, like. Noise figure is commonly used in communications systems because it provides a simple method to determine the impact of system noise on sensitivity. Non-inverting noise analysis diagram like monolithic microwave integrated circuits (MMICs) and discrete transistors in communications.

EDFA Noise Figure The spontaneous emission factor is a function of P_p and therefore is a function of (z) . We can average n_{sp} over the amplifier length. Therefore the noise figure and gain (as seen

NOISE IN FIBER OPTIC COMMUNICATION LINKS Robert Dahlgren Bob.Dahlgren@ieee

The physics of noise in optical communication links is of great interest in the design of fiber optic communication systems. In this report the role of noise in optical communications, and how it can

Optimum noise performance of optical amplifiers

The concept of noise figure F and noise measure M applicable to radio frequency and microwave amplifiers is reviewed and extended to cover optical amplifiers. Two noise figures are defined in the

Tutorial Fiber Amplifiers, Part 9: Noise of Fiber

Tutorial on fiber amplifiers. The ninth part discusses excess noise generated by fiber amplifiers. This is a quantum-mechanical phenomenon, and it is made stronger

Lecture 8: Intro to Optical Amplifiers

The ASE noise is one of the factor that sets the ultimate limits of optically amplified systems The optical signal-to-noise ratio (OSNR) cannot go below a given level to have acceptable BER at the receiver

OSA: Characterization of Optical Amplifier Gain and

The applicable models are equipped as standard with an optical amplifier analysis function (EDFA-NF) that automatically calculates the gain and noise figure (NF) of

Calculating noise figure in op amps

Of the three basic op amp circuits, it is easiest to find the input-referred noise for the non-inverting op amp amplifier, so it will be discussed first. Figure 1 shows a noise analysis diagram for a non

Lecture15_228B_S07_Final.ppt

Optical Amplifier OSNR The signal at the output of an optical amplifier in response to a noise free signal at the input is $P_{in} < P_{out} > = < G P_{in} + m P_N >$ The following formulation accounts for all noise terms that

Calculating noise figure in op amps

Recognizing the need to specify wide-band op amps in RF engineering terminology, some manufacturers do provide noise figure, but they seem to be the exception rather than the rule. Op

Theoretical Comparison of Noise Characteristics in Semiconductor and ...

Characteristics of the intensity noise, the phase noise, the frequency noise, and the spectral linewidth in the semiconductor optical amplifier (SOA) and the erbium doped fiber amplifier (EDFA) were

Theory of spontaneous emission factor and noise figure

Abstract This study develops a theory of noise in optical parametric amplifiers (OPAs) based on the quantum-mechanical Langevin equations.

Optical Noise

Similar to electronic amplifiers, an optical amplifier not only provides optical gain, but also introduces optical noise which degrades the optical signal-to-noise ratio (OSNR).

Chapter 11 OPTICAL AMPLIFIERS

Optical amplifier, as the name implies, is a device that amplifies an input optical signal. The amplification factor or gain can be higher than 1,000 (> 30 dB) in some devices. There are two principal types of

Optical Parametric Amplifiers

Optical parametric amplifiers use parametric nonlinear interactions (rather than laser amplification) for amplification, often of light pulses.

THE noise figure (NF) of an optical amplifier is an important figure of merit used to characterize the amplifier's potential for low-noise performance. Typically, low NF is needed for preamplifier and

Understanding Noise Figure in Amplifiers: Definition

Noise figure is an indispensable factor in amplifier design, affecting signal quality and performance. By understanding and managing noise figure,

Optical Amplifier (AMP)

The amount of noise added is determined by the "noise figure", which can also be specified in dB or as a ratio (in which case it is the noise factor). Please see the

Noise Figure

The noise figure is expressed in decibels (dB) and is derived from the noise factor, which is the ratio of the output noise power to the input noise power, adjusted for

Noise figure

Noise figure (NF) and noise factor (F) are figures of merit that indicate degradation of the signal-to-noise ratio (SNR) that is caused by components in a signal chain. These figures of merit are used to
