

Optical Interface Module Conversion

Overview

In many cases, the baud rate of the optical interface does not equal the baud rate of the electrical interface. In these cases, a gearbox is used within the module to convert between the two rates. Overview An optical module is a typically hot-pluggable optical transceiver used in high-bandwidth data communications applications. Optical modules typically have an electrical interface on the side that connects to a host device. There have been multiple variants of the electrical interface of optical modules that have been used over the years. The earliest forms of optical modules had an analog electrical interface. In the transmit direction, many different forms of optical modulation and multiplexing have been employed in optical modules. The most common modulation technique historically has been NRZ.
