

Prevention of Condensation in Distribution Boxes

Overview

Control humidity by using dehumidifiers or desiccants and keep it below 60% to 70% to prevent condensation. Based on industry observations, condensation typically invades through these seven pathways: 1. Temperature Rollercoasters When transformers, VFDs, or PLCs heat up interiors while external surfaces stay cool, you've created perfect conditions for condensation—like a cold drink "sweating" on a can. Condensation is caused by warm moist air coming into contact with a surface that is colder than the air's dew point. This is especially likely to happen outdoors when moisture and temperature changes are present. Electronics and electrical components don't like water and, therefore, moisture near these components. Linkwell offers trusted products that help you learn how to prevent condensation in electrical enclosures. While this might not seem like a big deal, inside.
