

Should the pigtail be melted or spliced first

Overview

Unlike a patch cord—which has connectors on both ends—the bare fiber end of a pigtail is designed to be permanently spliced (either by fusion or mechanical splicing) to the incoming fiber cable in the field. Executive Summary: A fiber optic pigtail is one of the most commonly specified yet least understood components in structured cabling. Get the wrong connector type, the wrong polish, or skip proper fusion splicing technique—and you're looking at elevated signal loss, increased back reflection, and a. A fiber pigtail is a short length of optical fiber that comes with a high-quality, factory-polished connector already installed on one end, leaving a length of exposed glass on the other. Instead of building a connector from scratch in the field, you simply fuse the “bare” end of the pigtail to. Terminating two ribbonized fibers together is typically achieved with a fusion splicer specifically designed for splicing multiple fibers. Fusion splicing of all fibers occurs concurrently.
