

The intelligent miniature busbar contains copper busbars

Overview

The busbar, with its high copper cross-section, can replace thick copper PCBs or special PCBs with copper inlays. As copper has a high thermal conductivity, busbars can efficiently dissipate heat from the overall system (heat conductor). They are used in particular where high currents need to be distributed to PCBs. The PowerBusbar design is provided by ABB busbar systems enable safe and easy cross-wiring of miniature circuit breakers, residual current devices and other Modular DIN-Rail products. The following points should be considered when selecting the correct busbars: REG terminal type (twin terminal or cage terminal), number of poles, device. The SPH series intelligent busbars feature an innovative structural design, allowing for overhead suspension and cabinet top bracket installation. It optimizes the end distribution structure, with a maximum busbar current capacity of up to 630A. The overall temperature rise of the busbar can be. In this new edition the calculation of current-carrying capacity has been greatly simplified by the provision of exact formulae for some common busbar configurations and graphical methods for others.
