

# The main distribution box has no ground wire

## Overview

There is no ground bar in it because it wasn't needed. You're talking about adding another sub panel off of that one. According to NEC Article 250, both the neutral and ground wires must be connected only in the main panel or at the first service disconnect. Problem. I am exploring a way to install an outdoor outlet out of my main electrical panel but I couldn't find any visible ground bar (s) that the ground wires (in green color) can connect to, nor do I see a ground wire somewhere attached to any bars at all other than one that got attached to a bonding. The 50 amps will be used for charging my EV in the garage while the 20 amps will be used for the garage opener, a light and a wall outlet. From my understanding, I will need to replace two 20 amps (top left) with a 70 amps double poles and 4 wires from here to my first sub-panel since it is already. Today, we're diving deep into the world of distribution box grounding, breaking down the standards, and shining a light on those sneaky mistakes that even experienced electricians sometimes make.
