

The optical power meter reading keeps fluctuating

Overview

Fluctuating optical power often results in: Common root causes include connector contamination, bending loss, or poor mechanical contact. Low power or unstable OSNR forces Forward Error Correction to work harder. Because optical networks. The meter is a bitch. You wouldn't connect an apc end to a upc end, right?

You also can't connect an apc end to a upc source. I feel like you already know the answer I've tested this light source and power meter with three different cables and each of the power meter readings seem low. Optical networks rely on precise power balance—too much power can damage receivers or distort signals, while insufficient. By learning to interpret readings accurately, you can prevent repeated testing, reduce troubleshooting time, and maintain reliable data transmission across your fiber network. This sensor responds to light within a sensitivity range of about 1 nanowatt (nW) to 1 milliwatt (mW).
