

Tube-type busbar structure

Overview

Busbars are produced in a variety of shapes, including flat strips, solid bars and rods, and are typically composed of copper, brass or aluminium as solid or hollow tubes. Some of these shapes allow heat to dissipate more efficiently due to their high surface area to volume ratio. An electric busbar (also written as bus bar) is a metallic bar, strip, tube, or rod that conducts current from one place to another in a safe manner with minimal energy losses. They are commonly used instead of wires or cables for high-current power distribution, high-voltage equipment, and so on. To mount a bus bar to an assembly structure, hardware (studs, holes, etc.) can be manufactured into the conductors. Due to their exceptional conductivity and durability, they are widely used in industrial electrical systems and electronic devices. The electric busbar, as a centralised node, also links several incoming and outgoing circuits and so on.
