

Used for relay protection tripping

Overview

A protection relay tripping circuit connects relays to breakers for fast fault isolation. Key components include trip/close coils and anti-pumping relays. Proper design, testing, and maintenance ensure reliable overcurrent, differential, and auto-reclosing protection in power. Auxiliary relays offer varying levels of functionality to best suit the tripping and control applications. They can be found installed in many control applications such as electrical utilities, power generation, electrical substations, transportation, industry, oil & gas, food & beverage, water. The type TR-1 relay is an auxiliary relay energized by protective relays to trip two circuit breakers. In this article we will discuss, the working, function, and significance of the Master Trip Relay, also known as the 86 relay.
