

Uses of Fibre Channel Cards

Overview

Fibre Channel is primarily deployed in enterprise environments that require: High IOPS and Low Latency: Mission-critical databases such as Oracle, SAP, and Microsoft SQL Server. Virtualization: Backend storage for large VMware and Hyper-V environments. Fibre Channel (FC) is a high-speed data transfer protocol providing in-order, lossless delivery of raw block data. Ethernet cards communicate using the TCP/IP protocol, a standard suite used for routing data across the internet and most. An Ethernet card, commonly known as a Network Interface Card (NIC), is a hardware component that allows devices to connect to a network, typically a Local Area Network (LAN). Unlike traditional Ethernet NICs, FC NICs are specifically designed for the demanding requirements of Storage Area Networks (SANs), offering exceptional speed. Fibre Channel serves a central role within the context of advanced data storage and networking technologies. Its high reliability, low latency, and high data throughput capabilities make it the backbone of enterprise-grade storage area networks (SANs). What makes Fibre Channel an industry-leading.
