

What is the formula for residual voltage in relay protection

Overview

Thus the residual voltage of system = $V_a + V_b + V_c = 0 + V \angle -120^\circ + V \angle 120^\circ = V \angle -60^\circ$ Thus we observe that, there exists a residual voltage in case of single line to ground fault. This residual voltage is measured by Residual Voltage Transformer. In a typical feeder OC protection scheme, what does the residual relay measure?
