

Which aggregation switch is recommended for a data center

Overview

In a large data center, a single pair of data center core switches typically interconnect multiple aggregation modules using 10 GigE Layer 3 interfaces. An aggregation switch is a network device that consolidates traffic from multiple access switches, wireless access points, or other edge devices and forwards it to core switches or routers. By bundling multiple network connections into a single high-bandwidth link, aggregation switches help. This chapter provides details about the multi-tier design that Cisco recommends for data centers. The multi-tier design model supports many web service architectures, including those based on Microsoft .NET and Java 2 Enterprise Edition. Data center switches provide Cisco Nexus Switches, managed through the Cisco Nexus. In a large network, we will have different types of switches involved and they play different roles when it comes to the functions. So, we have general guidelines and separate them into different layers. We usually follow this order: Internet > WAN > NAT (Router) > Core Layer Switch > Aggregation. With NVIDIA Spectrum switches with the LinkX cables and optics, you can build a web-scale scalable and efficient data center.
