

## Which power supply is the 24V power source for the integrated controller

### Overview

For PLCs that require 24V DC, a Switched Mode Power Supply (SMPS) is used to convert 230V AC to 24V DC. SMPS units are efficient and provide the necessary DC voltage with minimal ripple and noise. This power supply unit is equipped with an I/O interface, which permits connection of the Beckhoff Bus Terminals. The supply voltage supplies the CX system and the terminal Bus and Bus Terminal with a voltage of 24. Learn all about the power supply: modular and built-in devices that deliver electricity to the PLC backplane and modules, and learn the difference between control and field device power delivery. Every electronic device, at some level, has some form of conversion from line voltage down to an. In this article, we will learn the PLC power supply and operating voltages like 24V DC, 24V AC, 110V AC, and 240V AC. Refer to the technical specifications for information about the 5 VDC logic budget supplied by your CPU and the 5 VDC power. To power on the S7-1200 PLC, you must supply it with a stable 24V DC power source. Once powered, the CPU's LEDs (such as RUN/STOP, ERROR).
